Byrtus,L. W. Turchenek,Alberta Innovates - Technology Futures,Simon Fraser University,2012 Long term soil acidification monitoring was initiated by Alberta Environment in 1981 to track potential effects of acidic atmospheric deposition on soils in Alberta Two sites per year were established for a total of eight sites with baseline sampling completed in 1984 The sites were established each fall at eight locations in the province as follows Fort McMurray Cold Lake High Prairie Bruderheim Devon Rocky Mountain House Esther and Twin Butte In 2008 a ninth site was added in the Fort Saskatchewan Industrial Heartland area in order to provide a better assessment of acidification impacts from major industrial development and oil sands bitumen upgraders proposed for the region The original monitoring design entailed sampling every four years with the design enabling monitoring for a minimum of 44 years The objective of the program was initially to detect subtle changes in soil properties indicative of potentially long term changes in the ability of the soil to sustain plant growth This report presents the data and statistical analysis of six or seven monitoring events up to 2010 Document Trends in Soil Acidification in Alberta Based on Long Term Soil Acidification Monitoring from 1981 to 2010 Salim A. Security in Central and Eastern Europe Michael Wilson, B. Maliszewska-Kordybach, 2000-06-30 Agriculture is a crucial component of the economies of many of the countries in transition from a centrally planned to a market economy and the sector is by no means immune to the environmental and socioeconomic problems confronting the countries as a whole The concept of sustainable development provides a convenient framework for the formulation of government environmental policy for such countries especially those of them that aspire to join the EU and would thus be expected to meet EU environmental standards For agriculture this inevitably involves appropriate strategies for balancing crop and animal production while protecting the quality of the national soil and water resources There is thus an urgent need to compile exchange and evaluate current information on the quality of soils in these countries and to assess the potential impact of new management practices on the soil and on the wider environment

Alberta Oil Sands, 2012-11-07 At 170 billion barrels Canada's Oil Sands are the third largest reserves of developable oil in the world The Oil Sands now produce about 1.6 million barrels per day with production expected to double by 2025 to about 3.7 million barrels per day The Athabasca Oil Sands Region AOSR in northeastern Alberta is the largest of the three oil sands deposits Bitumen in the oil sands is recovered through one of two primary methods mining and drilling About 20 per cent of the reserves are close to the surface and can be mined using large shovels and trucks Of concern are the effects of the industrial development on the environment Both human made and natural sources emit oxides of sulphur and nitrogen trace elements and persistent organic compounds Of additional concern are ground level ozone and greenhouse gases Because of the requirement on operators to comply with the air quality regulatory policies and to address public concerns the not for profit multi stakeholder Wood Buffalo Environmental Association WBEA has since 1997 been closely monitoring air quality in AOSR In 2008 WBEA assembled a distinguished group of international scientists who have been conducting measurements and practical research on various aspects of air emissions and their potential effects on terrestrial receptors This book is a synthesis of the concepts and results of those on going studies It contains 19 chapters ranging from a global perspective of energy production measurement methodologies and behavior of various air pollutants during fossil fuel production in a boreal forest ecosystem towards designing and deploying a multi disciplinary proactive and long term environmental monitoring system that will also meet regulatory expectations Covers measurement of emissions from very large industrial sources in a region with huge international media profile Validation of measurement technologies can be applied globally The new approaches to ecological monitoring described can be applied in other forested regions

Corroding Terrain: Acid Rain and Altered Earth Jana Hanson, In our ever evolving world environmental issues continue to shape the path of our future Acid Rain and Altered Earth Soil Acidification's Toll on the Environment explores a pressing concern that has transforming implications for our precious ecosystems This enlightening book digs into the causes effects and solutions to soil acidification delving deep into the heart of this pressing matter The causes are multi faceted often stemming from the complex interactions between nature

and mankind As the acid rain falls from the heavens its impact on the environment is far reaching Exploring the effects of this pervasive phenomenon proves sobering as the delicate balance of our ecosystems is disrupted and forever changed by the altering acidity However hope is not lost as science and innovation provide potential solutions and remedies to combat soil acidification Through groundbreaking research and scientific breakthroughs an array of methods to restore and revive the affected soil are explored promising a brighter future for our planet Acid Rain and Altered Earth Soil Acidification s Toll on the Environment serves as a pivotal resource for both the environmentally concerned and the scientifically inclined It sheds light on this critical issue providing a comprehensive understanding of the causes effects and solutions related to soil acidification Gain a deeper comprehension of the intricate web of our environment and discover how we can work towards a sustainable and thriving future

Impact Models to Assess Regional Acidification Juha Kämäri, 1990-03-31 Sensitive receptors such as soil and fresh bodies of water are at the end of a long chain of events in the process of regional acidification This chain begins thousands of kilometers upwind at the emitters of acidifying pollutants The topics covered in this book are important in the study of regional acidification for two reasons First it is important to assess the sensitivity of terrestrial and aquatic ecosystems to the deposition of acidifying pollutants If the sensitivity of an ecosystem is known then international control strategies can be developed to reduce deposition in the receptor areas of greatest importance This is an important factor in designing the most effective strategies because of the very high costs of reducing emissions of acidifying pollutants Second it is important to be able to predict changes in ecosystems for decades into the future whether it be an improvement owing to decreases in acidifying emissions or alas a further deterioration because control strategies are nonexistent or inadequate In either event it is important to be able to judge the results of our actions Decision makers tend to be mistrustful of models unless they can judge their reliability The application and testing of the models in Part III of this book cover therefore an important facet of model building
