### The universe

The universe is more than a collection of \_\_\_\_\_ and stars or planets. The universe includes all of space, all matter and energy, time and people. The total universe is possibly infinite (impossible to measure), or not.

The \_\_\_\_\_ universe is what can be seen without the use of technology such as telescopes.

The \_\_\_\_\_ Wily galaxy, which our solar system is part of, is one of billions of galaxies in the observable universe. And the Sun in our solar system is one of hundreds of billions of stars just in the Wily Wily galaxy!

### Our Solar System

While it is difficult to know exactly how our solar system was formed, astronomers believe that it is over 4 billion years old.

In the center of our solar system is the \_\_\_\_\_ which the planets and dwarf planets orbit (travel around), some closer than others.

There are \_\_\_\_\_ planets, several dwarf planets, 79 moons or other objects orbit the planets plus comets, asteroids, space rocks and so on in our solar system.

The order of the planets from the closest to the Sun to the furthest from the Sun is - Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune \_\_\_\_\_ is the furthest planet in our solar system and \_\_\_\_\_ is the smallest planet.

### The Sun

The Sun in our solar system is a type of star called a yellow \_\_\_\_\_ star. It is the only star in our solar system and is 150 million kilometers from Earth.

The Sun is the largest object in our solar system and as a result, its gravity affects everything else. The Sun also affects many things on Earth, including the \_\_\_\_\_, the climate, ocean currents, seasons and the weather.

Although the Sun looks large to us, it is actually only an average sized \_\_\_\_\_ brown star in the universe (as smaller and some are nearly 100 times larger than the Sun).

### The Planets

The planets in our solar system are divided into two categories, inner planets and outer planets, by an \_\_\_\_\_ belt. The asteroid belt is an area of the solar system that contains millions of asteroids that are mainly made up of rock and metal.

The eight planets in our solar system can be organized into three groups based on their composition (what they are made of). The inner planets, Mercury, Venus, Earth and Mars, are known as \_\_\_\_\_ or terrestrial planets as they are mainly composed of rocks and minerals.

The outer planets, Jupiter and Saturn, are known as gas giants because of their size and that they are made of gases. Neptune and Uranus are known as the \_\_\_\_\_ giants. There are also five official dwarf planets (Ceres, Pluto, Haumea, Makemake, and Eris).

### The Moon

The Moon is neither a planet nor a star but a natural \_\_\_\_\_ that orbits the Earth. Most of the moons that orbit planets in our solar system have been named after characters from mythology. Earth's moon is called 'the moon' as it was the first one that people on Earth knew about.

Not all moons look like Earth's moon, some are large and dark, while others look like a ball of gas or white icebergs.

### The Kuiper Belt

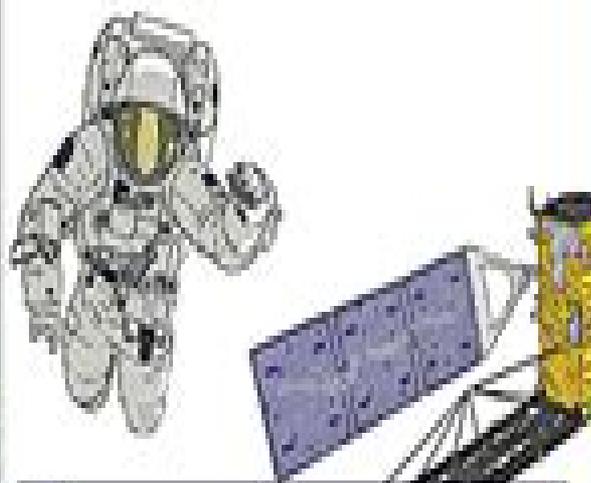

Our solar system extends out past Neptune to include the Kuiper belt. The Kuiper belt is a \_\_\_\_\_ composed of objects made of ice.

### Space Missions

Humans are currently endeavoring to explore the surface of Mercury and Pluto. There are also plans for three missions to return to explore Venus \_\_\_\_\_ is one of the most explored objects in our solar system. Scientists are currently looking for evidence of life existing on Mars.

Other missions to explore our solar system include:

- NASA's Juno (spacecraft) exploring Jupiter
- The New Horizons spacecraft from NASA visited Pluto in 2015 and is currently exploring the Kuiper belt.
- Other missions to explore Jupiter's moons, Europa, and Saturn's moon, Titan.
