Principles of Transaction Processing Philip A. Bernstein, Eric Newcomer, 2009-07-24 Principles of Transaction Processing is a comprehensive guide to developing applications designing systems and evaluating engineering products The book provides detailed discussions of the internal workings of transaction processing systems and it discusses how these systems work and how best to utilize them It covers the architecture of Web Application Servers and transactional communication paradigms The book is divided into 11 chapters which cover the following Overview of transaction processing application and system structure Software abstractions found in transaction processing systems Architecture of multitier applications and the functions of transactional middleware and database servers Queued transaction processing and its internals with IBM s Websphere MQ and Oracle s Stream AQ as examples Business process management and its mechanisms Description of the two phase locking function B tree locking and multigranularity locking used in SQL database systems and nested transaction locking System recovery and its failures Two phase commit protocol Comparison between the tradeoffs of replicating servers versus replication resources Transactional middleware products and standards Future trends such as cloud computing platforms composing scalable systems using distributed computing components the use of flash storage to replace disks and data streams from sensor devices as a source of transaction requests The text meets the needs of systems professionals such as IT application programmers who construct TP applications application analysts and product developers The book will also be invaluable to students and novices in application programming Complete revision of the classic non mathematical transaction processing reference for systems professionals Updated to focus on the needs of transaction processing via the Internet the main focus of business data processing investments via web application servers SOA and important new TP standards Retains the practical non mathematical but thorough conceptual basis of the first edition Transaction Processing Jim Gray, Andreas Reuter, 1992-09-30 The key to client server computing Transaction processing techniques are deeply ingrained in the fields of databases and operating systems and are used to monitor control and update information in modern computer systems This book will show you how large distributed heterogeneous computer systems can be made to work reliably Using transactions as a unifying conceptual framework the authors show how to build high performance distributed systems and high availability applications with finite budgets and risk The authors provide detailed explanations of why various problems occur as well as practical usable techniques for their solution Throughout the book examples and techniques are drawn from the most successful commercial and research systems Extensive use of compilable C code fragments demonstrates the many transaction processing algorithms presented in the book The book will be valuable to anyone interested in implementing distributed systems or client server architectures *Principles of Transaction Processing for the Systems Professional* Philip A. Inc Portland OR **Java Transaction Processing** Mark Cameron Little,Jonathan Maron,Greg Pavlik,2004 Addresses transactions related issues faced by java developers *OLTP* Billy G. Claybrook,1992-03-16 Offers comprehensive in depth coverage of the design of Online Transaction Processing OLTP which has gained increasing importance in today s world of distributed databases and downsized platforms OLTPs recent introduction in the open systems movement makes it of interest not only in the usual mainframe arena but with UNIX and OSI as well Includes the theory design and implementation of OLTP with regard to all current developments in the field **Transaction Processing: Past, Present, and Future** Alex Louwe Kooijmans,Elsie Ramos,Niek De Greef,Dominique Delhumeau,Donna Eng Dillenberger,Hilon Potter,Nigel Williams,IBM Redbooks,2012-09-29 The role of IT is becoming more prominent in people s daily lives and we are becoming increasingly dependent on computers More and more business transactions are being automated for example ordering a book at an online bookstore or transferring money to a bank account in another part of the world No matter the type of transaction we want it to be accurate and we want to have no doubts about its outcome Transactions are also becoming more complex driven by new ways of conducting business and new technologies Smartphones now allow us to conduct transactions anywhere and at anytime Technology paradigms such as Web 2 0 and business event processing enable businesses to increase the dynamics of a transaction through instrumentation that captures events analyzes the associated data and proactively interacts with the client in order to improve the customer experience To adapt to the increasing volume and complexity of transactions requires an ongoing assessment of the current way of supporting transactions with IT No matter what your business is you need to ensure that your transactions are properly completed with integrity Wrong or incomplete results can adversely affect client loyalty affect company profits and lead to claims lawsuits or fines Companies need to be able to rely on computer systems that are 100% reliable and guarantee transaction integrity at all times The IBM mainframe is such a platform Clients that have been using an IBM mainframe are conscious of its added value For this IBM Redguide™ publication we surveyed a number of companies that use the IBM mainframe and we asked them to tell us its most distinguishing qualities They answered unanimously reliability availability and scalability They also do not see an alternative for running their mission critical business workloads other than the IBM mainframe When we surveyed our clients we also asked them about the future Clearly major future trends demand significantly smarter faster and bigger transaction processing systems than we have today Some of these trends are the availability of new computing paradigms continuing growth of the mobile channel further integration of organizations massive growth of unstructured and uncertain data and increasing complexity of IT systems IBM continues to invest in mainframe technology leadership which protects years of client investments on this platform Today well known transaction processing TP middleware such as the IBM CICS IBM IMS IBM z TPF and IBM WebSphere Application Server products and also solutions for service oriented architecture SOA and business process management BPM are available and fully optimized on the IBM mainframe running the mission critical business workloads of many companies

the world over In 2010 IBM announced the IBM zEnterprise system introducing a hybrid computing platform that combines the traditional IBM mainframe capabilities and the ability to use IBM blade servers managed by a single management software With zEnterprise you can significantly reduce the complexity of your IT and achieve better service levels while continuing to benefit from traditional mainframe strengths in transaction processing
