

Static Analysis

- Detects defects in code before executing the application.
- Ensures fewer defects during unit testing.
- Finds syntax errors, security vulnerabilities, coding standard violations, and logic errors.

- Can analyze the entire codebase, including unused code, since it doesn't require code execution.
- More cost-effective in the long run because it catches issues early, reducing the cost of fixing bugs later in the development cycle.
- Helps ensure compliance with coding standards like MISRA, CERT, and others to satisfy safety-critical regulations.

Dynamic Analysis

- Requires code execution to detect defects in the application.
- Ensures fewer defects during integration and system testing.
- Finds runtime issues like memory leaks, performance bottlenecks, and elusive vulnerabilities and defects.

- Only analyzes the code that is executed during the tests, potentially missing unexecuted portions.
- May be time-consuming and costly due to the need for real-time execution and more extensive testing environments.
- Required for specific runtime behavior verifications defined in functional safety standards like DO-178C, ISO 26262, and others.
