Philip B. Eppard, George Monteiro, 1983 *Ideal Flow Network for Transportation Research* Kardi Teknomo, 2026-02-05 This book introduces groundbreaking concepts for understanding and managing urban traffic congestion through the lens of the Ideal Flow Network (IFN). Developed over a decade of research grounded in graph theory, information theory, and Markov chains principles, it reveals that every network has a natural optimal steady-state flow distribution, which is an intrinsic property of a network's structure independent of transient demand. The central thesis presents Premagic Equilibrium, a theoretical state where congestion is uniformly distributed across all links, and mathematically proves how this ideal resolves the classic tension between individual driver choices and system-wide efficiency. Planners will discover practical, data-light techniques to calibrate the model that sidesteps costly origin-destination matrices. Readers will explore a formal chemistry of transport policy where interventions are defined as auditable atomic and molecular actions. This approach provides a systematic grammar for policy design, simulation, and optimization. All of these original insights aim to provide an innovative theoretical solution to traffic congestion. With accessible mathematical explanations, step-by-step guides, and integration with practical tools such as IFN Transport software (available as open source on GitHub and online in Revoledu.com) and an IFN Excel Add-In, this book empowers readers to experiment with the theory and apply it to real-world situations. Illustrations, tables, and diagrams clarify complex ideas, making the content approachable for both professionals and students in transport.
