Poisson Point Processes and Their Application to Markov Processes Kiyosi Itô, 2015-12-24 An extension problem often called a boundary problem of Markov processes has been studied particularly in the case of one dimensional diffusion processes by W Feller K Itô and H P McKean among others In this book Itô discussed a case of a general Markov process with state space S and a specified point $a \in S$ called a boundary The problem is to obtain all possible recurrent extensions of a given minimal process i.e. the process on $S \setminus a$ which is absorbed on reaching the boundary a The study in this lecture is restricted to a simpler case of the boundary a being a discontinuous entrance point leaving a more general case of a continuous entrance point to future works He established a one to one correspondence between a recurrent extension and a pair of a positive measure ν on $S \setminus a$ called the jumping in measure and a non negative number m
