The Sand Compaction Pile Method:

The Sand Compaction Pile Method Masaki Kitazume, 2005-08-04 The Sand Compaction Pile or SCP method is used frequently in construction to form compacted sand piles by vibration dynamic impact or static excitation in soft ground Originally developed in Japan to improve stability or compressibility and to prevent liquefaction failure in loose sand the SCP method is now often applied to soft clay ground to ensure stability and reduce ground settlement This book presents detailed descriptions of design execution quality control equipment and assurance aspects of the SCP method illustrating the theory with case studies from around Japan and also including a thorough overview of the existing literature on research and development carried out since the 1950s Two final chapters cover vital aspects of design procedures for clay and sandy ground to enable practitioners to frame an appropriate set of parameters for durable and cost efficient design *State of the Art for Design and Construction of Sand Compaction Piles* Richard D. Barksdale, 1987 Sand compaction piles can be used to improve marginal sites for stability liquefaction and settlement applications They have been employed extensively in Japan for many years to improve land reclaimed from the sea The advantages and disadvantages of using sand compaction piles are compared with other vibro compaction techniques such as stone columns Methods are described for construction of sand compaction piles on land and over water Design theories are given for the utilization of sand compaction piles at sites underlain by both cohesionless and cohesive soils For sites underlain by cohesionless sands procedures are presented for estimating the increase in standard penetration resistance in both the sand compaction pile and the surrounding sand Techniques are described for estimating stability and one dimensional consolidation settlement of sites underlain by cohesive soils that have been improved with sand compaction piles Finally typical applications of sand compaction piles are described and practical design criteria and practices are given Introduction to the Sand Compaction Pile Method as Applied to Stabilization of Soft Foundation Grounds Kiichi Tanimoto, 1973 **Present State of Sand Compaction Pile in Japan** H. Aboshi, M. Kuwabara, Y. Mizuno, 1991 The sand compaction pile method hereinafter abbreviated as SCP method has been developed in Japan as an improvement method for soft ground One of the reasons of the above is that SCP method can be applied to both sandy and clayey soil Complicated soil strata in Japan have also contributed to the development of this method This paper evaluates and verifies the applicability of the design procedure of SCP method to sandy and clayey grounds by comparing the measured data with designed values Moreover the latest technology of SCP method that is the Mechatronic Consolidation System which can set up sand compaction piles in accordance with the variation of soil properties is also introduced Effects of Installation Method on Sand Compaction Piles in Clay in the Centrifuge F-H Lee, Y-W Ng, K-Y Yong, 2001 The effects of the method of installation of centrifuge model sand compaction piles SCPs in soft clay are studied The comparative study involves the frozen pile method a 1 g displacement method and a high g displacement method The results show that although all the SCP improved models exhibit higher strength compared to the unimproved models both

displacement methods confer additional enhancement in strength to ground improvement which was not present in the frozen pile models In addition wavy settlement patterns were also observed in the frozen pile models but not in the displacement models The observed differences were explained by the postulated differences in stress states of the improved models For the frozen pile models thawing during reconsolidation was postulated to lead to a reduction in effective lateral stress resulting in further softening of the clay On the other hand the cavity expansion effect caused by the displacement methods was postulated to lead to a set up in the strength of the clay thereby resulting in better integrity in the response of the improved ground to loading
